SUMMARY

- Application of machine learning in medical imaging for reduced artifacts and better image quality.
- 5+ years of research experience in medical image reconstruction, processing, and analysis.
- Hands-on experience with medical imaging devices including flat panel detectors and CT systems.

EXPERIENCE

Graduate Student Research Assistant, Johns Hopkins University, Baltimore, MD 07/2020-now

- Developed learning-based autofocus algorithm for motion artifact reduction in cone-beam CT, leveraging deep CNN for image feature extraction, encouraging realism of reconstructed anatomies.
- Advanced efficient encoding of spatial-temporal 4D information via adaptive sampling strategy and implicit neural representation, which are applied to modeling of patient motion and blood flow.
- Derived diffusion equations for quantum noise in CT projections from high dose to low dose based on imaging physics, providing foundation for noise reduction in CT via stable diffusion method.
- Adapted image reconstruction and processing pipelines to the Autograd framework of PyTorch, allowing gradient propagation between different domains for fast and reliable optimization.
- Gathered experimental data from scanning of cadavers and realistically built phantom using clinical CT systems and collected real patient scans through collaboration with radiologist from JH Hospital.

Physics Intern, GE Healthcare, Troy, NY 06/2018-08/2018

- Investigated improvement in thallium doping control during production of flat panel X-ray detectors through experimentation of production conditions such as temperature, pressure, and doping duration.
- Built data management toolkit to organize, visualize, and analyze X-ray panel postproduction data for quality control and examination of potential factors affecting the production quality.

Undergraduate Researcher, University of Illinois & Carle Hospital, Urbana, IL 09/2017-09/2019

- Investigated quantitative Positron Emission Tomography (PET) via advanced reconstruction methods, such as random rejection algorithm, and post-scan tracking of radioactive tracer.
- Published research in development of amorphous Selenium-based flat panel X-ray detectors.

SCHEDULED PROFESSIONAL ENGAGEMENT

Research Intern, Siemens Healthineers, Princeton, NJ 06/2024-09/2024

- Develop learning-based methods for multi-organ motion registration in multimodality imaging settings with improved approaches for modelling organ motion in 4D imaging.
- Prepare large scale training and testing data via high-fidelity simulation based on imaging physics.

EDUCATION

Ph.D. in Biomedical Engineering, Johns Hopkins University Expected 04/2025

Research topic: Learning-based Autofocus for Motion Compensation in CT

Coursework: Human Anatomy, Machine Learning, Principles of X-ray Imaging, Medical Image Analysis, Image Processing, Information Theory, Nonlinear Optimization

BSc in Physics, University of Illinois Urbana-Champaign (UIUC) 05/2020 (GPA: 3.90/4.00)

Coursework: Classical Mechanics, Quantum Mechanics, Electrodynamics, Optics, Electronic Circuits

BSc in Nuclear, Plasma, and Radiological Engineering, UIUC 05/2020 (GPA: 3.90/4.00)

Coursework: Imaging Sensors, Radiation Interaction, Radiological Instruments, Biology, Chemistry
